Key Concepts

- Project scheduling provides a tool for communication, managing stakeholders' expectations, and as a basis for performance reporting. 
- The project management team selects a scheduling method (such as critical path or an agile approach). Then the project activities, planned dates, durations, resources, dependencies, and constraints are entered into a scheduling tool to create a schedule model for the project. 
- This could be a simple activity list, a Gantt chart, Network Diagram or other method.
- For smaller projects, defining activities, sequencing activities, estimating durations, and developing the schedule model are so tightly linked that they are viewed as a single process.

Tailoring Considerations

Life cycle approach. ←

- What is the most appropriate life cycle approach that allows for a more detailed schedule?

Resource availability.

- What are the factors influencing durations (such as the correlation between available resources and their productivity)?

Project dimensions.

- How will the presence of project complexity, technological uncertainty, novelty, pace, or progress tracking (such as earned value, percentage red-yellow-green or "stop light" indicators) impact the desired level of?

Technology support.

- Is technology used to develop, record, transmit, receive, and store schedule model information and is it readily accessible?

Agile Waterfall (S) — (D)
